

ABSTRACT OF THE DISCLOSURE

An electron beam exposure mask comprises a main mask and one or more compensation masks. The main mask has a plurality of 5 first defined masks. The compensation mask includes one or more non-defective second defined masks each having a pattern configuration to be formed in a defective among said first defined masks. In performing exposures by using this electron beam exposure mask, first defined masks are used as long as the 10 first defined masks are non-defective, and the second defined mask corresponding to a first defined mask is used when the first defined mask is defective.
